

# Agent Hub Platform

## Multi-Cloud AI Agent Orchestration

Build, deploy, and monitor autonomous AI agents across AWS, Azure & GCP with native MCP support, vector databases, and real-time learning analytics.

|                  |            |             |             |
|------------------|------------|-------------|-------------|
| PRODUCTION READY | MCP NATIVE | MULTI-CLOUD | 300+ AGENTS |
|------------------|------------|-------------|-------------|

### Platform at a Glance

|               |               |                     |                |
|---------------|---------------|---------------------|----------------|
| 180K+         | 30+           | 6                   | 300+           |
| Lines of Code | API Endpoints | Vector DB Providers | Example Agents |

### Core Features

|                                                                                                                                                                                   |                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Multi-Agent Orchestration</b><br>Production-grade workflow engine coordinates multiple AI agents in parallel or sequential pipelines with state management and error recovery. | <b>Learning Analytics Engine</b><br>Proprietary AI-powered system tracks interactions, measures user learning velocity, and generates personalized insights — zero code changes required. |
| <b>MCP Native Integration</b><br>Deep Model Context Protocol support with 12 dedicated service files and Docker MCP servers. One of the few platforms with true native MCP.       | <b>Vector Database Hub</b><br>Unified interface for Pinecone, Weaviate, Qdrant, ChromaDB, OpenSearch, and PostgreSQL — switch providers without rewriting ingestion logic.                |
| <b>AI Cost Optimizer</b><br>Automatic model routing: Haiku for simple tasks, Sonnet for complex ones. AWS Cost Explorer integration shows real savings per execution.             | <b>Enterprise Security</b><br>JWT + API key auth, RBAC (Admin / User / Viewer), Helmet headers, rate limiting, audit logging, and comprehensive request monitoring.                       |

### Technology Stack

| Backend                                                                 | Frontend                                                          | AI / Cloud                                                                           |
|-------------------------------------------------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Node.js 18 · TypeScript Express.js · SQLite · Redis Docker · AWS Lambda | React 19 · TypeScript React Bootstrap 5 Recharts · React Router 7 | Claude 3.5 Sonnet / Haiku AWS Bedrock · OpenAI · Gemini Pinecone · Weaviate · Qdrant |

### Integrations & Ecosystem

|            |                                                                   |
|------------|-------------------------------------------------------------------|
| AI Models  | AWS Bedrock · OpenAI · Google Gemini · Anthropic · Ollama (local) |
| Vector DBs | Pinecone · Weaviate · Qdrant · ChromaDB · OpenSearch · PostgreSQL |
| Dev Tools  | GitHub · VS Code Extension · CLI Tool · MCP Protocol · Docker     |
| Infra      | AWS Lambda · EC2 · LocalStack · Docker Compose · PM2              |
| Frameworks | CrewAI · LangGraph · AutoGen · LangChain · Custom Agents          |

### Use Cases

|                                                                                                                                                                         |                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>QA &amp; Test Automation</b><br>Auto-generate, execute, and track test cases across your entire codebase with AI-powered coverage analysis and smart failure triage. | <b>Security Scanning</b><br>Continuous vulnerability detection, OWASP compliance checks, and AI-generated remediation suggestions via agent workflows.            |
| <b>Business Intelligence</b><br>Connect data sources, orchestrate analysis pipelines, and surface insights through natural language queries — no SQL required.          | <b>DevOps Automation</b><br>Deployment readiness assessment, infrastructure analysis, and CI/CD pipeline agents with deep GitHub integration and webhook support. |

Deployment Options

|                        |                                                                            |
|------------------------|----------------------------------------------------------------------------|
| <b>AWS Lambda</b>      | Serverless · Auto-scaling · Pay-per-execution · Native Bedrock routing     |
| <b>Docker Compose</b>  | Full local stack · LocalStack dev environment · One-command startup        |
| <b>EC2 / VPS</b>       | Traditional server · PM2 process management · Full control                 |
| <b>Bedrock Managed</b> | Native AWS integration · Cost-optimized model routing · CloudWatch metrics |

Market Opportunity

| SaaS Revenue Potential                                                                     | IP / Codebase Value                                                                            | Target Buyers                                                                           |
|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>\$50 - \$500 / mo per team</b><br>Enterprise: \$2K - \$10K / mo Multi-tenant SaaS ready | <b>\$100K - \$300K engineering value</b><br>Proprietary analytics IP MCP-native differentiator | <b>AWS · Azure · Google</b><br>DevOps & TestOps platforms Enterprise automation vendors |

Why It Stands Out

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <b>MCP Native</b>         | Full Model Context Protocol support — rare among agent platforms             |
| <b>Learning Analytics</b> | Proprietary interaction tracking and insight engine, zero integration effort |
| <b>Cost Intelligence</b>  | Automatic model selection saves spend on every inference call                |
| <b>300+ Agent Library</b> | Ready-to-use agents across CrewAI, LangGraph, AutoGen, and custom stacks     |
| <b>VS Code Extension</b>  | Developer-facing distribution channel, ready to publish to marketplace       |

Open to partnerships, licensing discussions, and enterprise pilots. Building the future of autonomous AI agent infrastructure.
